

## Process Analysis and Redesign

In conjunction with Inteck's Readiness Assessment, Inteck will conduct a Process Analysis and Redesign (IPAR). After the MEDITECH® Advanced Clinical (AC) modules have been implemented Inteck will review the IPAR and implement it after modifying it where appropriate. This process will ensure that the manual processes and operations will be using the AC applications optimally and using the new functionalities.

### Processes

It's important that specific steps are taken before the implementation of MEDITECH Advanced Clinical modules to maximize success and efficiency. To determine that services being provided are beneficial there are indicators to keep in mind.

Inteck will:

- Identify Key Personnel such as Administrator, Core Team and Patient Caregivers
- Identify areas of improvement opportunities
- Review and get approval from executive staff and end users for operational processes
- Develop processes for future methodologies with "Best" Standard of Care
- Supply training material and technical support documentation

### Deliverables

Upon completion your facility will be supported by Inteck with the following deliverables:

- An executive analysis summary targeting the current clinical and business state with opportunities of improvement
- Project Plans
- Performance processes, additional analyses (if appropriate) and recommendations
- Recommendations how the functionality of the MEDITECH AC applications will affect processes

### Duration

Before beginning any project it is best to understand the timeline. The duration of services for this type of project typically takes approximately 3-4 weeks before implementation of the ACS modules and 1 month after live of the modules. Having Inteck's experienced professionals onsite to review workflow and the current state of operations can enhance the outcome of the project.

### Conclusion

A Process Analysis and Redesign program will improve the use and functionality of the AC modules within a healthcare facility. Understanding how a Process Analysis and Redesign program works can help a facility make informed decisions that ultimately save time and money.

In collaboration with MEDITECH, Inteck has developed a strategic process analysis and redesign of the MEDITECH AC modules. Providing experienced consultants, Inteck uses proven techniques. Such techniques identify problems and their solutions during the implementation of MEDITECH software. Inteck offers a proven, comprehensive set of implementation and support services. These services help an organization effectively install MEDITECH applications.
